BoilerShop	Urgent	Not Urgent
Important	- Users must be able to input multiple product URLs into the application - The application must display information about each product, such as prices, ratings, and descriptions - Users must be able to provide their own preferences for the product they are looking for in order to find the best possible match - Must contain a ranking system of the products best suited towards the user's interests	- Providing explanations for why the chosen product best fits the user's interests and needs - Design a more user-friendly and cleaner interface using Java - Ensuring the application can handle potentially invalid URL links or missing information around the product itself while still maintaining an accurate ranking system of the choices given
Not Important	- The application must integrate the CartScout API in order to grab details from the product URLS - Incorporating a JSON Data parser in order to convert API responses into objects for the Java program itself - Utilizing Java HttpClient in order to allow communication between the API and the Java Program	- Allowing users to create their own accounts and save certain preferences for products categories - User forum where people can post their recommendations on a certain product within a certain category - Potentially making it so the application searches through product URL links itself rather than analyzing user provided links - Potentially incorporating a product recommendation history for a certain category - Allowing users to filter their product URLs to certain brands, which could work alongside making the application search through a series of product URLs
